

PRIMARY CARE CLINIC -- FOLLOW-UP NOTE

Patient ID: PT-40021 | Date: 2026-07-15

Mr. David Park is a 62-year-old male returning for diabetes follow-up. He was seen 6 months ago in January 2026 when his HbA1c was 7.5%. At that time, we increased his Metformin and added Sitagliptin.

Unfortunately, medication adherence has been inconsistent.

CURRENT LABORATORY RESULTS (drawn 2026-07-14):

Hemoglobin A1c: 8.0% (Previous: 7.5% on 2026-01-10)

Fasting Glucose: 165 mg/dL

ASSESSMENT: The current HbA1c of 8.0% is at the HEDIS threshold. The January value of 7.5% showed better control but the current reading is what matters for compliance reporting.
